CN Notes

TCP

TCP is a connection-oriented, reliable transport protocol. It uses a three-way handshake (SYN, SYN-ACK, ACK), sequence numbers, acknowledgements and retransmission. It also provides flow control and congestion control. It is used for web, email and file transfer.

UDP

UDP is a connectionless, unreliable transport protocol. It has no handshake, no retransmission and no ordering guarantee, so it is faster and has less overhead. It is used for video streaming, DNS and online games.

OSI Model

The OSI model has seven layers: Physical, Data Link, Network, Transport, Session, Presentation and Application. Each layer provides services to the layer above and uses services of the layer below.
